

**Exercise (Indistinguishability of sums and products).** *Let  $\mathcal{X}_0$  and  $\mathcal{X}_1$  be  $(t_1, \varepsilon_1)$ -indistinguishable and let  $\mathcal{Y}_0$  and  $\mathcal{Y}_1$  be  $(t_2, \varepsilon_2)$ -indistinguishable. Estimate the computational distance between the following games*

$$\begin{array}{cc} \mathcal{G}_0 & \mathcal{G}_0 \\ \left[ \begin{array}{l} x \leftarrow \mathcal{X}_0 \\ y \leftarrow \mathcal{Y}_0 \\ u = x + y \\ v = x \cdot y \\ \textbf{return Adv}(u, v) \end{array} \right. & \left[ \begin{array}{l} x \leftarrow \mathcal{X}_1 \\ y \leftarrow \mathcal{Y}_1 \\ u = x + y \\ v = x \cdot y \\ \textbf{return Adv}(u, v) \end{array} \right. \end{array}$$

*Highlight all hidden assumptions. Do you get different results when you know that  $\text{Adv}$  ignores the second argument. Formalise this and explain why the resulting bound is different.*

**Solution.**
